Release Notes

Public Release

Version 1.0.03	MD5 6861AFD77311CFCD3BA0459CEBD762C9
Features	• DispBtn command now supports vol+ / vol- / mute parameters, and is restricted to IP or RS-232 control; CEC only supports power on | off. • Added option for Telnet to never timeout. This is the default setting. • Added option to enable / disable 4k-to-1080p down-scaler.
Bug Fixes	• Fixed an issue where if Auto Switch fallback was interrupted, then fallback to the last active source was not executed. If input is switched to an empty input, then Auto Switch fallback executes, and on countdown to 0, the input is switched back to last active source. • Fixed an issue where the learned EDID could not be recalled. • Fixed an issue where DispBtn on | off would not execute. • Fixed an issue where pressing the DISPLAY button on the front panel, would not result in feedback. • Fixed an issue where any inter-VLAN communication would close the Telnet daemon. • Fixed an issue with the RS232zone command chaining, when using an AT-HDVS-200-RX.
Known Issues	• When using an AppleTV 4K (5th generation AppleTV), Dolby Atmos will not pass through the AT-OME-ST31.
